DAY 37 - PRO

Experimentation & A/B Test Thinking

Primary tool: Statistics / Python

What you are learning

Hypotheses, treatment/control, effect size, uncertainty and common pitfalls.

Learning objectives

- Formulate H0/H1

- Calculate group metrics

- Interpret uncertainty

- Avoid p-value misuse

Worked practical

Analyze a synthetic intervention dataset and write a cautious decision memo.

Source / Input	Method	Output / Check
Raw data	Apply the lesson skill	Result linked to source
Change one input	Recalculate / rerun	Confirm expected change
Control total / test	Validate	Explain the result

Guided practice

1. Recreate the lesson idea on a small example.
2. Change inputs and predict the result before recalculating.
3. Complete the supplied independent dataset in the required tool.
4. Create a control check or reconciliation.
5. Explain the result in ordinary language.

AI coaching

Ask AI to argue against your conclusion and identify threats to validity.

AI discipline

Attempt first. Use AI for explanation, hints, debugging, critique, test cases and mock questioning. Never submit output you cannot explain and independently verify.

Independent exercise

Evaluate a simple experiment.

Common failure modes

- Wrong grain or key.
- Formula/query/code answers a different question.
- Missing or unmatched records are silently ignored.
- Findings are not reconciled to the numbers.
- AI-generated logic is accepted without testing.

Mastery gate

[ ] I can reproduce the method without copying.
[ ] I can trace the result to the source.
[ ] I have a QA/control check.
[ ] I can explain a limitation.
[ ] I can answer an assessor's follow-up question without asking AI.
